

RAW DATA TO PRODUCTION DASHBOARDS

Activation Webinar Series

Account Engineering Team | September 2026

Safe Harbor and Disclaimers

Other than statements of historical fact, all statements contained in these materials and any accompanying oral commentary (collectively, the “Materials”) are forward-looking statements within the meaning of Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended, including statements regarding (i) our future operating results, targets, or financial position; (ii) our business strategy, plans, opportunities, or priorities; (iii) the release, adoption, and use of our new or enhanced products, services, and technology offerings, including those that are under development or not generally available; (iv) market size and growth, trends, and competitive considerations; (v) our vision, strategy and expected benefits relating to artificial intelligence (AI), the enterprise AI revolution, Snowflake Cortex AI, Snowpark, Snowflake Marketplace, the AI Data Cloud, and AI Data Clouds for specific industries or product categories, including the expected benefits and network effects of the AI Data Cloud; and (vi) the integration, interoperability, and availability of our products, services, and technology offerings with and on third-party products and platforms, including public cloud platforms and AI models. These forward-looking statements are subject to a number of known and unknown risks, uncertainties, and assumptions, including those described under the heading “Risk Factors” and elsewhere in the Annual Reports on Form 10-K and the Quarterly Reports on Form 10-Q that Snowflake files with the Securities and Exchange Commission from time to time. In light of these risks, uncertainties, and assumptions, the future events and trends discussed in the Materials may not occur, and actual results could differ materially and adversely from those expressed or implied in the forward-looking statements. As a result, you should not rely on any forwarding-looking statements as predictions of future events. Forward-looking statements speak only as of the date the statements are first made and are based on information available to Snowflake at the time those statements are made and/or management’s good faith belief as of that time. Except as required by law, we undertake no obligation, and do not intend, to update the forward-looking statements in these Materials.

Any future product or roadmap information (collectively, the “Roadmap”) is intended to outline general product direction. The Roadmap is not a commitment, promise, or legal obligation for Snowflake to deliver any future products, features, or functionality; and is not intended to be, and shall not be deemed to be, incorporated into any contract. The actual timing of any product, feature, or functionality that is ultimately made available may be different from what is presented in the Roadmap. The Roadmap information should not be used when making a purchasing decision. In case of conflict between the information contained in the Materials and official Snowflake documentation, official Snowflake documentation should take precedence over these Materials. Further, note that Snowflake has made no determination as to whether separate fees will be charged for any future products, features, and/or functionality which may ultimately be made available. Snowflake may, in its own discretion, choose to charge separate fees for the delivery of any future products, features, and/or functionality which are ultimately made available.

The Materials may contain information provided by third-parties. Snowflake has not independently verified this information, and usage of this information does not mean or imply that Snowflake has adopted this information as its own or independently verified its accuracy.

What We'll Build

One pipeline from raw orders to a refreshing revenue dashboard

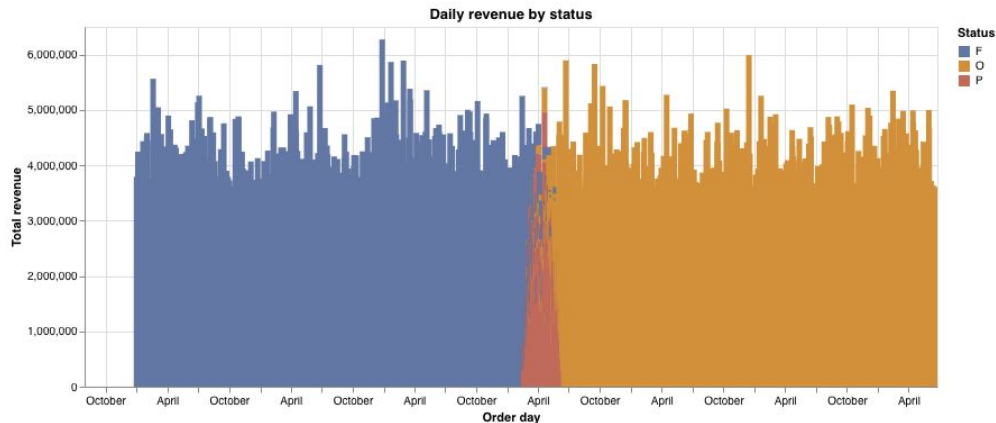

1 Land 50,000 raw orders in Bronze

2 Refine to Silver with a Dynamic Table

3 Aggregate to Gold for reporting

4 React to change with Streams and Tasks

5 Serve Gold to an approved dashboard

By the end, the Gold Dynamic Table refreshes against a lag target and the notebook dashboard reads straight from it.

SECTION 1

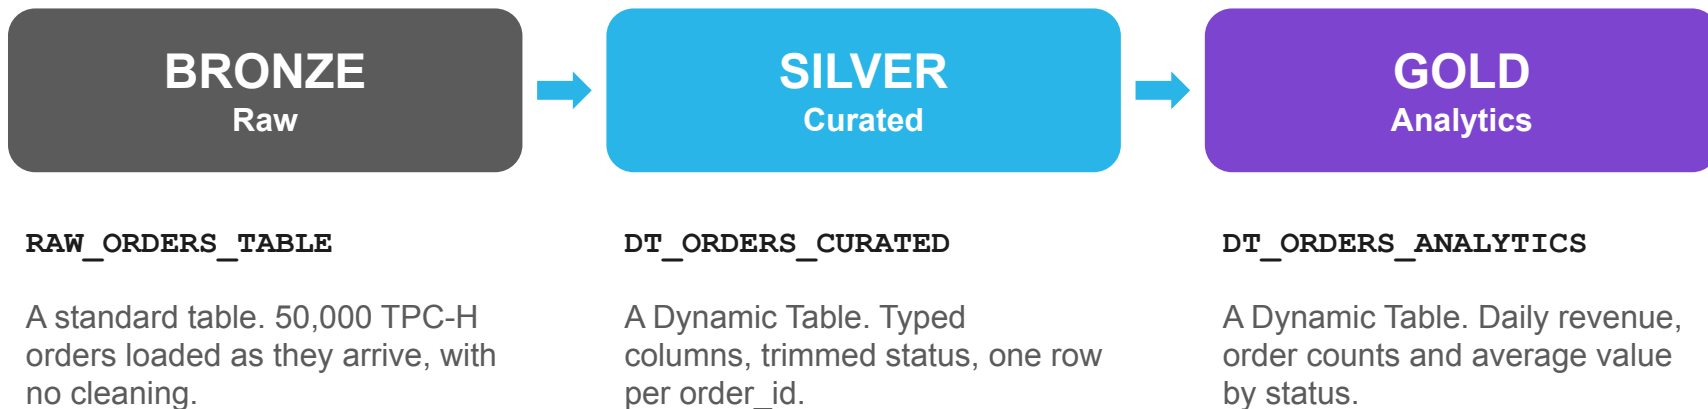

MEDALLION ARCHITECTURE

OVERVIEW (BRONZE / SILVER / GOLD)

Medallion Architecture

Three layers in one database, progressively refined

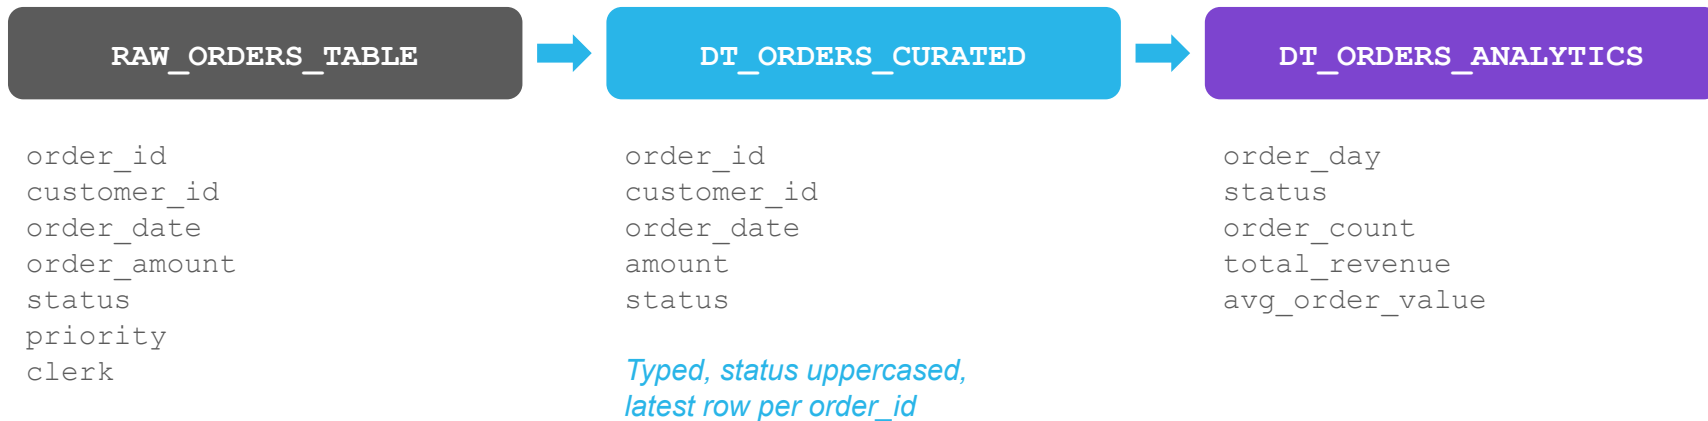

Bronze, Silver and Gold are naming conventions in this lab, not enforced guarantees. All three objects live in the same PUBLIC schema.

From Orders to Daily Revenue

What each layer actually contains in this lab

Silver keeps the order grain. The grain changes at Gold: one row per order becomes one row per day and status.

SECTION 2

DYNAMIC TABLES — DECLARATIVE PIPELINES

Dynamic Tables: Define the Result

You declare the output; Snowflake maintains it against a freshness target

Declare the Result

Set a Freshness Target

Define the Transformation

```
CREATE OR REPLACE DYNAMIC TABLE DT_ORDERS_CURATED
  TARGET_LAG = '1 minute'
  WAREHOUSE = RAW_DATA_TO_PRODUCTION_DASHBOARDS_WH
  REFRESH_MODE = INCREMENTAL
AS
SELECT order_id, customer_id, order_date,
       amount, status
FROM RAW_ORDERS_TABLE
WHERE order_id IS NOT NULL
QUALIFY ROW_NUMBER() OVER (
    PARTITION BY order_id ORDER BY order_date DESC
) = 1;
```

TARGET_LAG is a best-effort staleness target, not a refresh interval. REFRESH_MODE resolves at creation — confirm it with SHOW DYNAMIC TABLES.

Choose the Mode, Inspect the Refresh

Refresh mode resolves at creation — then you verify what it chose

INCREMENTAL

Applies only the changed rows.
Requires a supported query shape.

FULL

Recomputes the entire result
from scratch on every refresh.

ADAPTIVE

Normally refreshes
incrementally, and may
reinitialize.

```
SHOW DYNAMIC TABLES;  -- refresh_mode, refresh_mode_reason

SELECT name, refresh_action, reinit_reason
FROM TABLE(INFORMATION_SCHEMA.DYNAMIC_TABLE_REFRESH_HISTORY());
```

AUTO resolves once at creation and does not re-choose per refresh. In this lab the EXCEPT example resolves to FULL.

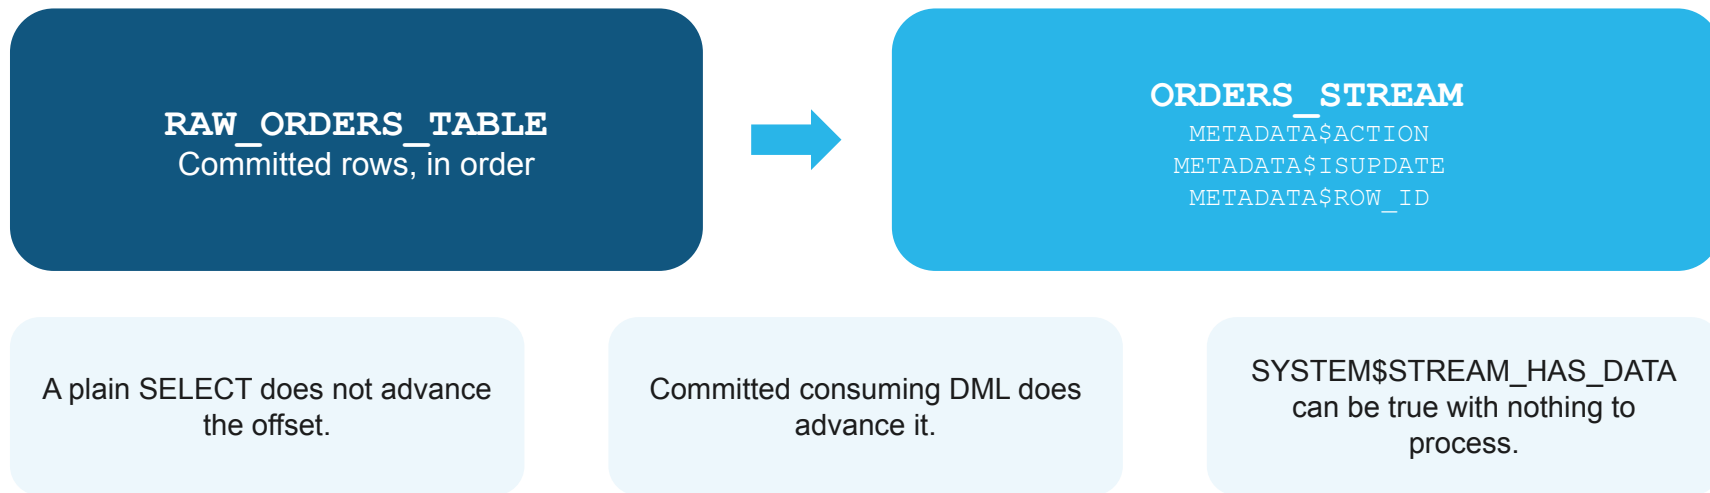

SECTION 3

STREAMS + TASKS — EVENT-DRIVEN CDC

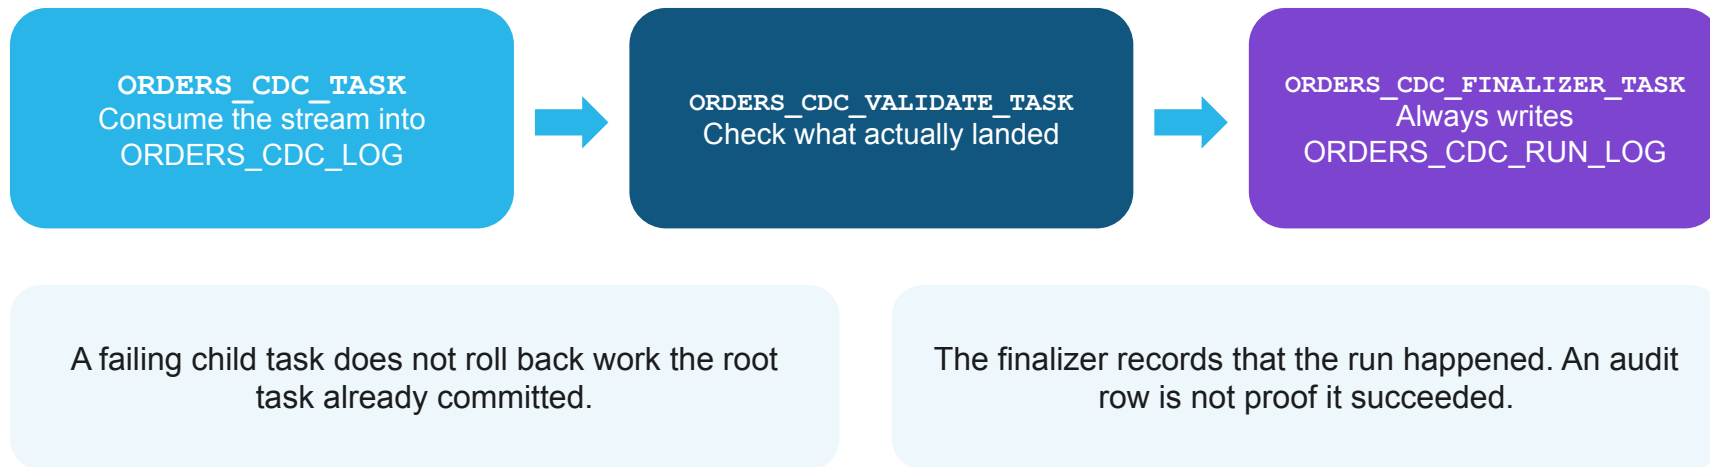

Table Stream: What Changed?

A stream tracks an offset, not a copy of your data

Capture, Validate, Finalize

A three-task graph, with a finalizer that always records the run

The runnable demo sends no email. The notification step is a walkthrough only.

SECTION 4

DBT ON SNOWFLAKE — CODE-FIRST TRANSFORMATIONS

dbt Models, Tests and Dependencies

Sources, models and tests resolve into a dependency graph

```
dbt_project.yml
```

```
models/  
  sources.yml      -- raw.RAW_ORDERS_TABLE  
  orders_clean.sql -- materialized='table'  
  schema.yml       -- not_null, unique
```

source: raw.RAW_ORDERS_TABLE

model: orders_clean

tests: not_null, unique

dbt build runs the selected tests; dbt run does not. This model and the Dynamic Table example both read RAW_ORDERS_TABLE, but they do not produce identical results.

From Repository to Execution

A git push is not a deployment — these are three distinct steps

A git push updates the repository. It does not deploy the project, and it does not run it.

Each step is a distinct object: a GIT REPOSITORY, a DBT PROJECT, and an execution or a TASK that runs it.

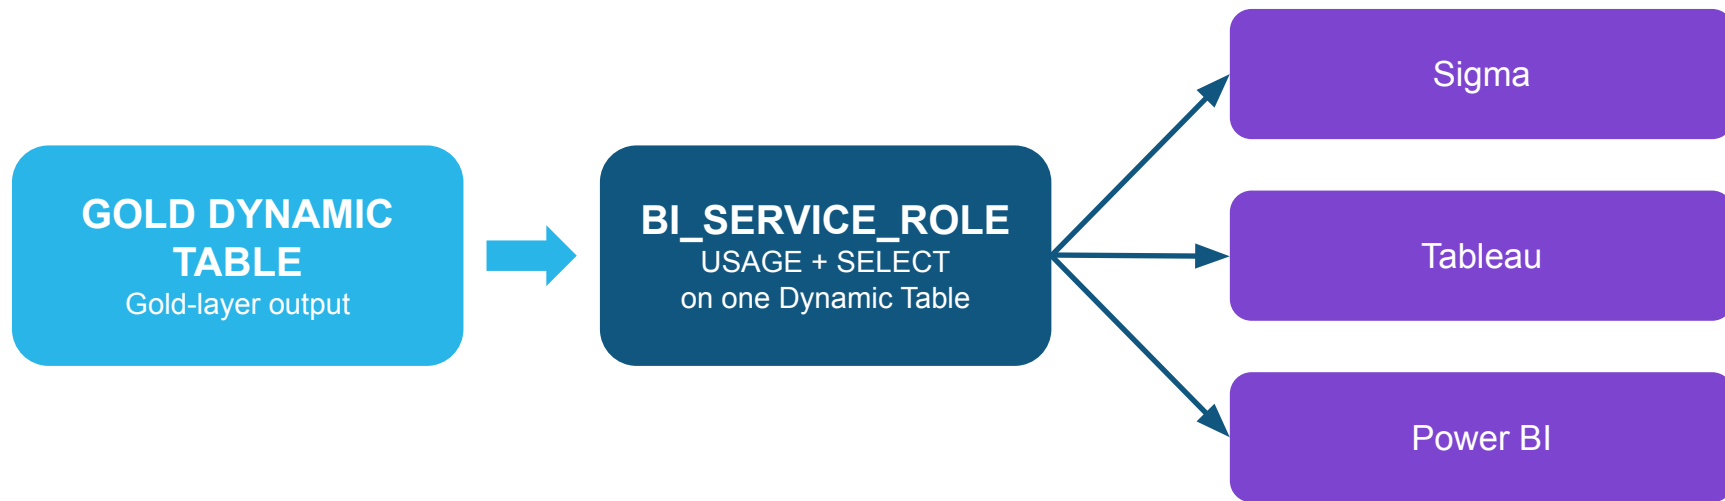

SECTION 5

BI TOOL CONNECTION + WORKSPACES DASHBOARD AND STREAMLIT PATH

Serve Gold Safely

One least-privilege role exposes the Gold Dynamic Table to approved BI tools

Read the Dashboard, Trace the Result

Every number on screen traces back to the Gold Dynamic Table

Gold rows = COUNT(*)

Total orders = SUM (ORDER_COUNT)

Total revenue = SUM (TOTAL_REVENUE)

Freshest order day = MAX (ORDER_DAY)

	<u>A</u> Gold rows	<u>A</u> Total orders	<u>A</u> Total revenue	<u>A</u> Freshest order day
1	2,594	50,000	\$7,650,456,966.13	1998-08-02

Freshest order day is the newest order date in the data, not the time the Dynamic Table last refreshed.

Choose the Control You Need

Three ways to transform, and what each one gives you

DYNAMIC TABLES

Declarative

You state the result. Snowflake maintains it against a lag target.

Best for keeping a table fresh.

STREAMS + TASKS

Imperative, event-driven

You control each step and can audit every run.

Best for custom logic on change.

dbt PROJECTS

Code-first

Version control, tests and a dependency graph.

Best for team-owned transformation projects.

These are not mutually exclusive. This lab uses all three against the same Bronze table.

THANK YOU
